Subject: **Pneumatic Control Valves**

The Labrie, Wittke, Leach, Pendpac and Juggler product lines all utilize various pneumatic control valve assemblies throughout their systems, commonly referred to as "Mac" valves. Labrie has worked extensively with the manufacturer of these valves to ensure that the OEM-specified product is suited to operate within our operational environment.

Providing routine maintenance is critical in ensuring the best service life possible from the pneumatic control valves. This must include daily draining of the air tanks and dryers to remove all moisture from the system, and the proper maintenance of the air filter. The chassis air compressor must also be properly maintained to keep the migration of compressor oil into the air system at a minimum.

When replacing the pneumatic air valves, insist upon OEM LabriePlus parts. Although valves meeting the fit and even of the same manufacturer may be readily obtained, they will most likely not meet the rigid specifications of the OEM product, which are uniquely engineered for our systems, including the use of premium seals and high PSI internal spring ratings.
