Subject: **Electronic Control System PC Connection Kits**

The various control systems for Labrie Enviroquip Group products, both past and present production models, allow the connection of a PC to aid in both troubleshooting and adjusting the various control functions of the system. For the IFM and Delastek systems, a modem may also be connected to allow remote diagnostics by LabriePlus.

Kits are available to allow the connection of a PC to the various operating control systems of Labrie Enviroquip Group products, and may be purchased through LabriePlus. The chart on the following page identifies these kits by part number; they may be ordered through LabriePlus.

These various kits connect to the PC's DB9 serial port; it has been noted that many PC manufacturers are no longer supplying this port on laptop computers. If no serial port is available, a USB to serial port adapter may be used, however be aware that some adapters are not compatible with these operating systems. LabriePlus suggests using the Gigaware part number 26-949 USB-A to serial cable, available through Radio Shack.

The software used is compatible with Microsoft's Windows XP & Vista operating systems. For connection to a PC using the Microsoft Windows 7 operating system, please contact the LabriePlus Service Department for assistance; unfortunately the Easy Supervisor software in not compatible with Windows 7. At this time, compatibility of the various software packages with the Windows 8 operating system has not been tested.

Please contact the LabriePlus Service Department at (800) 231-2771 with any questions or for further information.
