Model: Labrie with IFM Multiplex Control System

Subject: Multi Cycle Program Change

Labrie has been researching the effectiveness of the multi cycle pack feature incorporated into the Labrie side loader control system. The conclusion of this study has revealed that multi cycle settings greater than three (3) provide negligible increase in the payload density, and cause the moving components of the pack system to wear at an accelerated rate.

Effective with units manufactures in March 2018 or later, the programming for the side loader pack system multicycle function has changed. The selectable range has been modified to a maximum of three (3) pack cycles.

Please contact LabriePlus at (800) 231-2771 with any questions or for further information.
